Monitoraggio

Il rapporto rappresenta i risultati del monitoraggio ambientale delle lagune del Delta del Po effettuato nell'anno 2021 mediante rilievi in continuo dei parametri chimico-fisici di interesse, quali:

- Temperatura
- pH
- conducibilità
- salinità
- ossigeno disciolto
- clorofilla (parametro al momento non elaborato)

Il monitoraggio in continuo permette di evidenziare, in tempo reale, una situazione di disturbo ambientale, quali anossia e distrofia, che potrebbe compromettere il delicato equilibrio di questi ecosistemi e le attività produttive di acquacoltura di notevole importanza per il territorio provinciale. I risultati di questo monitoraggio, integrati con quelli del monitoraggio regionale ARPAV delle acque di transizione delle lagune del delta del Po, contribuiscono inoltre alla valutazione dello stato ambientale ai sensi del D.L. 152/06 e s.m.i.

A volte la mancanza di una continuità di dati dipende dal fatto che le sonde richiedono una manutenzione continua che non sempre può essere effettuata in campo, ad esempio a causa di condizioni meteo sfavorevoli.

Inoltre le sonde, periodicamente, vengono rimosse per una manutenzione più completa.

Area di studio

L'area in esame è compresa tra il fiume Adige a Nord ed il Po di Gnocca a Sud estendendosi quindi lungo tutta la zona del Delta del Po.

Di seguito vengono elencate le lagune nelle quali si effettua il monitoraggio.

Laguna Marinetta

Bacino ricadente nel territorio comunale di Rosolina. Comunica con il mare attraverso le bocche situate tra gli scanni e il litorale antistante di Porto Levante e con la laguna di Caleri tramite un canale. Inoltre è limitrofo alla laguna Vallona.

Laguna Vallona

Direttamente collegata con la laguna di Marinetta è un'area per la maggior parte privata. Nel giugno del 2014 è stato riaperto il collegamento diretto con il mare.

Laguna Barbamarco - Busiura

Situata tra il Po di Maistra e il Po Busa di Tramontana, occupa una superficie di 800 ha. ed è circondata da quattro valli da pesca, comunica con il mare Adriatico attraverso la bocca nord e sud.

Laguna Basson

Laguna prospiciente al mare aperto con cui comunica direttamente attraverso una stretta bocca che ne limita il ricambio idrico (G. Rallo, M. Pandolfi, 1988). Gli apporti di acqua dolce, frequenti e abbondanti, provenienti sia dal Po di Venezia che dalla Busa di Scirocco, contribuiscono al deposito di materiali limosi nel bacino.

Laguna Canarin

Laguna a forma di anello allungato comunica con il mare solo attraverso la bocca Nord.

Sacca di Scardovari

Situata nell'area meridionale del Delta del Po è la laguna più estesa e comunica con il mare attraverso due bocche artificiali. Una caratteristica interessante riguarda i fondali che rimangono sempre coperti dall'acqua anche in corrispondenza dei minimi di marea.

Rete di monitoraggio

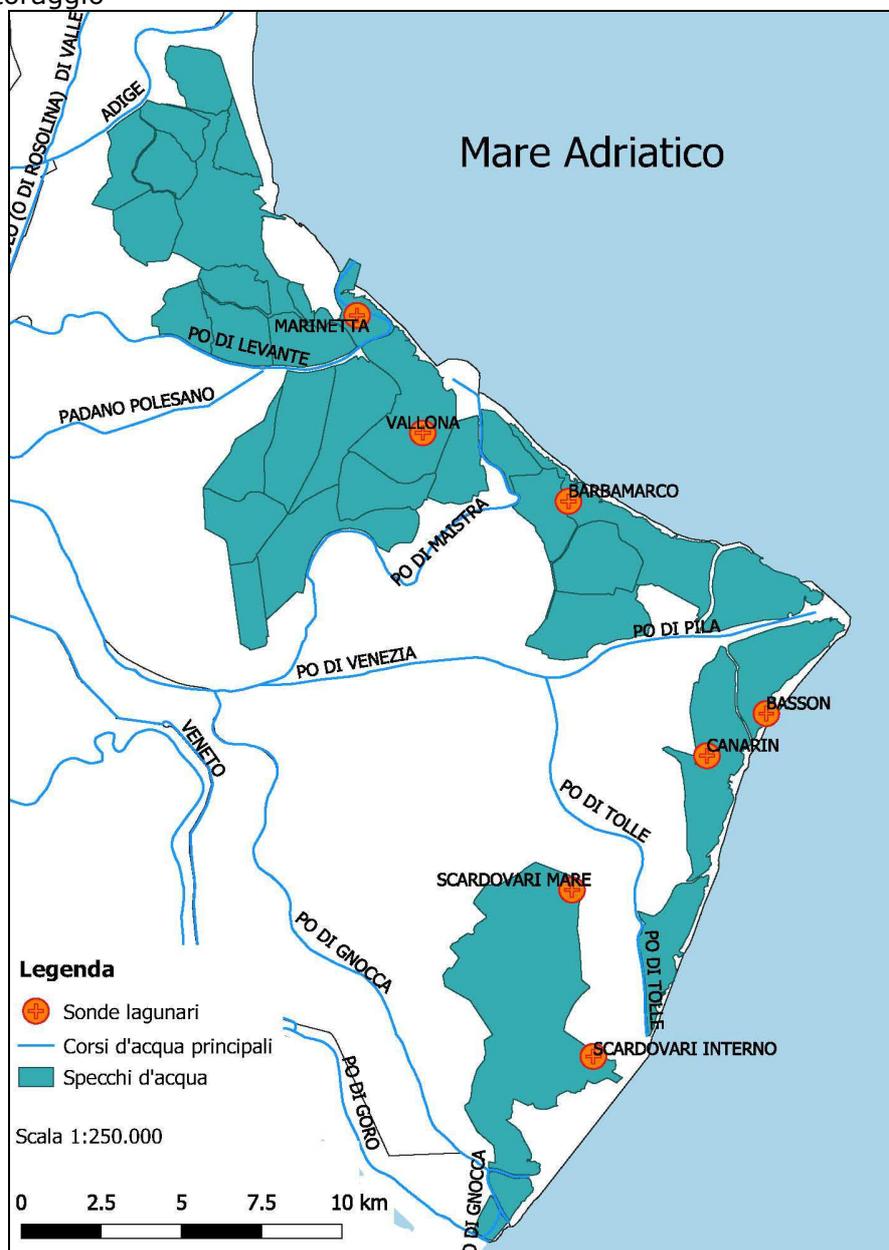

Come previsto dall'Accordo di Programma firmato nel febbraio 2006 tra ARPAV, Provincia di Rovigo, Consorzio di Bonifica Delta Po-Adige e l'ex Azienda ULSS 19 di Adria ora Azienda Ulss 5 Polesana, la rete di monitoraggio è composta da 7 sonde multiparametriche dislocate in sei lagune: 2 sono posizionate nella laguna di Scardovari (in corrispondenza della bocca a mare e nella parte interna), le restanti nelle lagune di Marinetta, Vallona, Basson, Canarin e Barbamarco.

Nel 2021 l'Ente Parco Delta del Po nell'ambito del progetto Interreg Italia – Croazia PEPSEA ha acquistato due nuove stazioni di monitoraggio, che sono state installate rispettivamente in laguna di Caleri e nella sacca di Scardovari, località S.Giulia.

Inoltre sono stati acquistati tre sensori di misura di clorofilla, installati nelle stazioni di Marinetta, Vallona e Canarin.

Ne consegue che dal 2022 la rete di monitoraggio sarà ampliata e risulterà essere costituita da 9 stazioni di misura.

Area di monitoraggio

Strumentazione

La sonda collocata nella laguna di Marinetta è di proprietà dell'Amministrazione Provinciale di Rovigo, mentre le altre appartengono ad ARPAV ed al Consorzio di Bonifica Delta Po-Adige.

Tutte le stazioni di monitoraggio sono attrezzate con sonde YSI EXO2 o EXO3.

Nella tabella seguente sono indicate le tipologie di sonde installate e i parametri chimico-fisici per ogni singola stazione di monitoraggio.

| STAZIONE | SONDA | SENSORI | | | | |
|--------------------|-------|-------------|----|---------------------------|-----------------------|------------|
| | | Temperatura | pH | Conducibilità Salinità | Ossigeno disciolto | Clorofilla |
| MARINETTA | EXO3 | X | X | X | X | |
| VALLONA | EXO2 | X | X | X | X | |
| BASSON | EXO3 | X | X | X | X | |
| CANARIN | EXO3 | X | X | X | X | |
| BARBAMARCO | EXO3 | X | X | X | X | X |
| SCARDOVARI MARE | EXO2 | X | X | X | X | X |
| SCARDOVARI INTERNO | EXO3 | X | X | X | X | X |

Nelle sonde YSI EXO gli slot per i sensori sono universali, quindi tutti i sensori possono essere installati in tutte le porte, con facili operazioni plug & play. I sensori sono smart e, appena installati, sono in grado di comunicare con la sonda configurandosi automaticamente. Inoltre ogni sensore memorizza al suo interno tutti i dati relativi all'ultima calibrazione. Tutti i sensori sono in titanio con connettori "wet mateable" in grado di garantire le connessioni sonda-sensori anche in condizioni di bagnato, evitando così corto-circuiti e sovratensioni.

Le sonde sono munite di sensori di:

- temperatura
- pH
- conducibilità
- ossigeno disciolto LDO
- salinità

Nelle stazioni di monitoraggio di Barbamarco, Scardovari mare e Scardovari interno è stato installato anche un sensore per la misura della Clorofilla totale.

Le sonde sono collegate attraverso un cavo ad un terminale di superficie che registra le informazioni inviate dalla sonda e provvede alla loro alimentazione.

Lo stesso invia, mediante GSM, i dati ad una stazione di riferimento consentendo lo scarico e utilizzo degli stessi.

La stazione è alimentata da batterie ricaricabili attraverso un pannello fotovoltaico posizionato sulla stazione stessa. Inoltre è protetta da eventuali scariche elettriche dovute ad eventi atmosferici mediante dei moduli soppressori di transienti.

Le letture avvengono contemporaneamente per tutti i sensori ad intervalli di 30 minuti.

Manutenzione e parametri rilevati

I dati delle sonde multiparametriche sono controllati in campo attraverso misure di controllo con una sonda di riferimento portatile. In caso di anomalie i sensori vengono sostituiti con altri precedentemente calibrati, con soluzioni di riferimento, in laboratorio.

I trasferimenti dalla terraferma al sito dove sono installate le sonde, avvengono grazie alla collaborazione con i pescatori dei Consorzi che operano nelle lagune.

La manutenzione consta di due uscite settimanali nel periodo primavera/estate e ogni quindici giorni nel periodo autunno/inverno.

Le uscite si effettuano in maniera alternata da un tecnico di ARPAV ed un tecnico della ditta esterna, opportunamente formati; occasionalmente in contemporanea da entrambi i tecnici.

Nello specifico durante la manutenzione vengono eseguite:

- letture in parallelo della sonda installata con una sonda di riferimento;
- recupero e pulizia del corpo sonda, dei sensori e della gabbia di protezione;
- verifica del corretto funzionamento, dopo la pulizia, della sonda confrontandola con la sonda di riferimento.

Con cadenze temporali diverse viene inoltre effettuata anche la pulizia del pannello fotovoltaico, del tubo di calma che contiene la sonda, la verifica di tutte le parti elettriche nonché del sistema di acquisizione e trasmissione dati.

Al termine di ogni manutenzione si procede alla validazione dei dati prodotti nel periodo che intercorre tra due manutenzioni e successivamente alla pubblicazione grafica degli stessi sul bollettino giornaliero.

Temperatura

La temperatura viene misurata in gradi centigradi e le sue variazioni risultano essere importanti per lo sviluppo, la riproduzione e la crescita delle popolazioni di molluschi che rappresentano una fonte produttiva di notevole importanza per gli operatori della zona.

Alla temperatura sono correlati i problemi di eutrofizzazione e il tasso di ossigeno disciolto che è tanto più alto quanto più bassa è la temperatura dell'acqua.

pH

Il pH indica l'acidità dell'acqua e i suoi valori vanno da 0 (acido) a 14 (basico) passando per 7 (neutro).

Nonostante l'ampio spettro, il pH in condizioni normali non subisce mai brusche variazioni grazie al potere tampone dell'acqua. Normalmente è intorno a valori di neutralità (tra 6 e 9) che risultano essere vitali per gli organismi acquatici.

Brusche variazioni possono essere causate da scarichi improvvisi di sostanze chimiche acide o basiche che in genere hanno conseguenze letali per la vita acquatica.

Valori di pH inferiori alla norma, ma non in maniera evidente, possono essere indice di fenomeni di decomposizione organica, mentre valori appena superiori alla norma possono essere collegati a fenomeni importanti di fioriture algali.

Salinità

La salinità viene espressa in mg/L e calcolata a partire dal valore della conducibilità. Essa dipende molto dall'apporto dei fiumi, dalle precipitazioni e dalle maree.

Ossigeno disciolto

L'Ossigeno è uno dei parametri determinanti per la vita dei molluschi.

La quantità di ossigeno disciolto nell'acqua è variabile. La sua presenza dipende dallo scambio gassoso che avviene tra acqua e aria, dalla sua solubilità, dalle correnti di marea, dal moto ondoso, dalla fotosintesi algale (fitoplancton) e dalla respirazione.

La solubilità dell'ossigeno in acqua dipende dalla salinità e dalla temperatura.

Alla stessa temperatura l'acqua dolce contiene più ossigeno di quella salata.

Gli scambi gassosi aria-acqua sono correlati alla solubilità, al vento e al moto ondoso

Le correnti di marea e il moto ondoso favoriscono l'aumento della quantità di ossigeno in soluzione.

Il bilancio dell'ossigeno è dato dal rapporto fotosintesi/respirazione: se il rapporto è $>$ di 1 abbiamo sviluppo di ossigeno perché la fotosintesi è maggiore della respirazione e quindi aumenta la quantità di ossigeno disciolto, se $<$ a 1 abbiamo consumo di ossigeno e quindi una diminuzione dell'ossigeno disciolto perché i processi di respirazione e decomposizione della sostanza organica prevalgono sui processi di produzione primaria o foto sintetica.

Diffusione dei risultati

I dati rilevati dalle sonde multiparametriche vengono analizzati e divulgati con cadenza giornaliera attraverso la pubblicazione di un bollettino sul sito dell'Agenzia Regionale per l'Ambiente .

Il bollettino riporta i valori medi, minimi e massimi dei parametri rilevati nella giornata precedente e l'andamento rispetto al giorno prima in modo da avere sotto controllo l'evoluzione dello stato della laguna.

Vengono riportati ,in forma grafica, i dati dei cicli di marea scaricati dalla Rete Mareografica Nazionale presso la stazione di Venezia e anche i valori di portata, giornaliera e settimanale del fiume Po rilevati presso la stazione di Pontelagoscuro (FE) dall'ARPA Emilia Romagna.

I bollettini vengono di volta in volta anche aggiornati con i dati validati.

Bollettino BOE DELTA DEL PO 107 del 17 Aprile 2021

Il bollettino è suddiviso in tre sezioni; nella prima sezione sono contenuti i valori medi, minimi e massimi dei dati non validati riferiti al giorno precedente l'emissione del bollettino giornaliero e la tendenza, di ogni singolo valore, rispetto ai dati del giorno prima. Nella seconda sezione sono inseriti i grafici che illustrano il confronto dei singoli parametri tra le varie aree lagunari monitorate. I dati utilizzati per l'elaborazione risultano essere quelli validati e riguardano la settimana di riferimento indicata. Nella terza sezione sono rappresentati i dati di marea, prodotti dalla Rete mareografica nazionale rilevati presso le stazioni di Venezia e di Ravenna e i dati medi di portata rilevati presso la stazione ARPA dell'Emilia Romagna di Pontelagoscuro.

Sintesi dei risultati

Per un'interpretazione rapida dei dati sono stati presi in considerazione i limiti di sopravvivenza e i range ottimali di crescita per la fauna ittica. In particolare sono stati presi come riferimento quelli relativi alla vongola verace, essendo l'area di studio a vocazione molluschiicola. I valori riportati in tabella 1 sono stati presi dal "Manuale di divulgazione Serie Acquacoltura TAPES PHILIPPINARUM" (pubblicazione edita da Veneto Agricoltura - Azienda regionale per i settori agricolo forestali e agro alimentari).

Tabella 1 – Limiti vitali e range ottimale di crescita per *Tapes philippinarum*

| Parametro | Limiti vitali | | Intervallo ottimale | |
|------------------|---------------|----|---------------------|-----|
| | | | | |
| Temperatura - °C | 0 | 31 | 16 | 23 |
| pH – unità di pH | >7,5 | | 7,8 | 8,2 |
| Salinità - ppm | 13 | 50 | 25 | 35 |
| Ossigeno – mg/l | > 3,56 | | 6,0 | 8,0 |

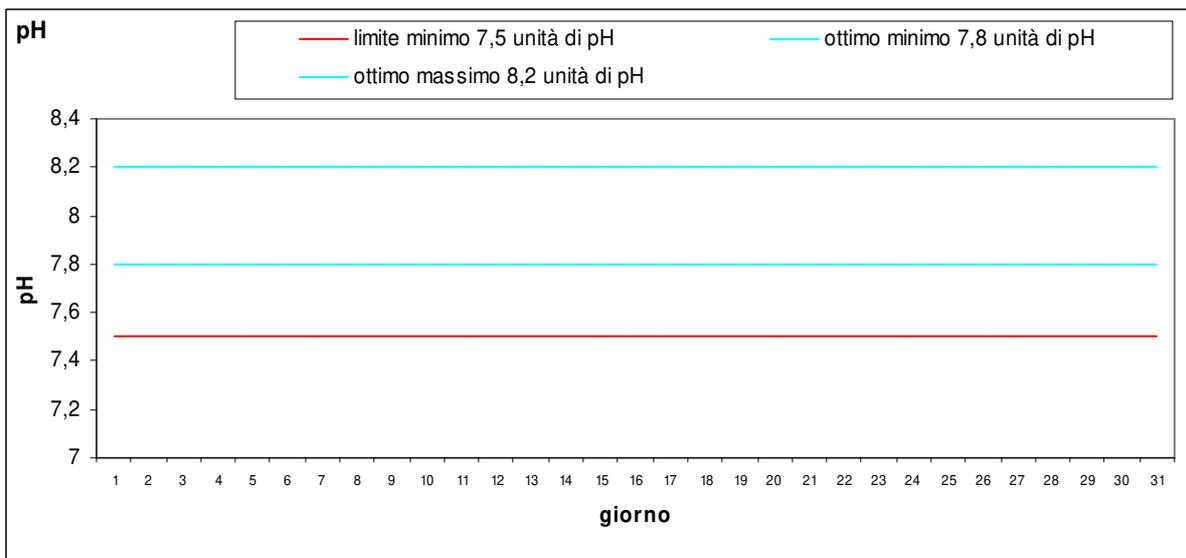

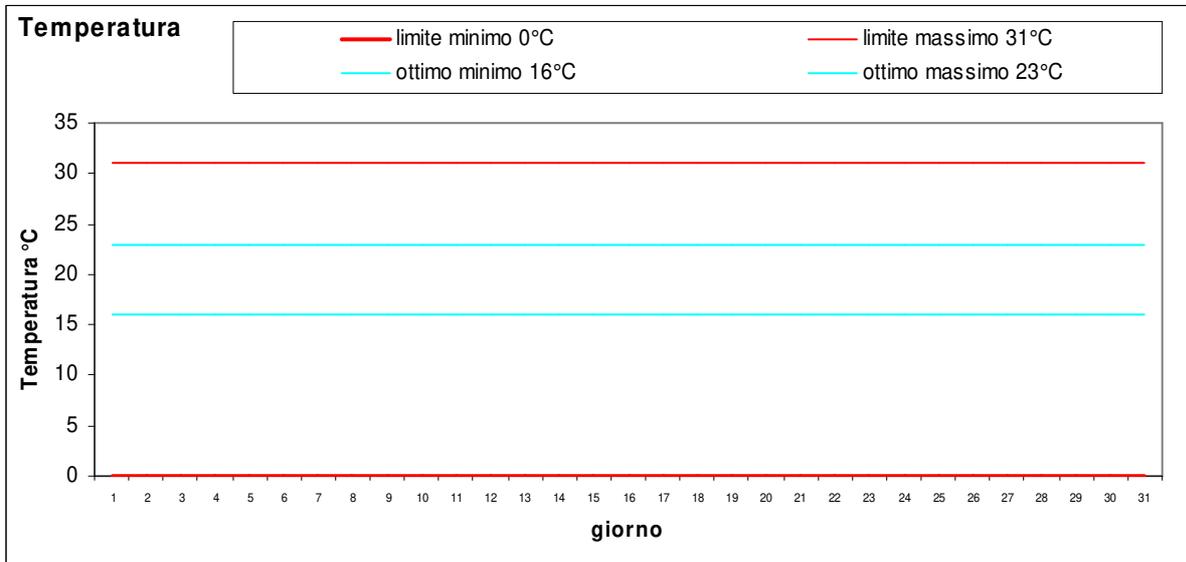

I risultati del monitoraggio sono rappresentati in forma di grafico a partire dalla pagina 19. Per ogni parametro c'è un grafico dedicato, nel quale sono evidenziati con linee continue colorate i limiti superiore ed inferiore di sopravvivenza (color rosso) e i limiti superiore ed inferiore dell'intervallo ottimale di crescita (color azzurro) presi come valore numerico senza il simbolo ">" o "<" (vedi tabella 1). Ad esempio per il pH il limite vitale riportato in grafico corrisponde a 7.5 unità di pH, mentre per l'ossigeno disciolto il limite vitale riportato in grafico è uguale a 3,56 mg/l.

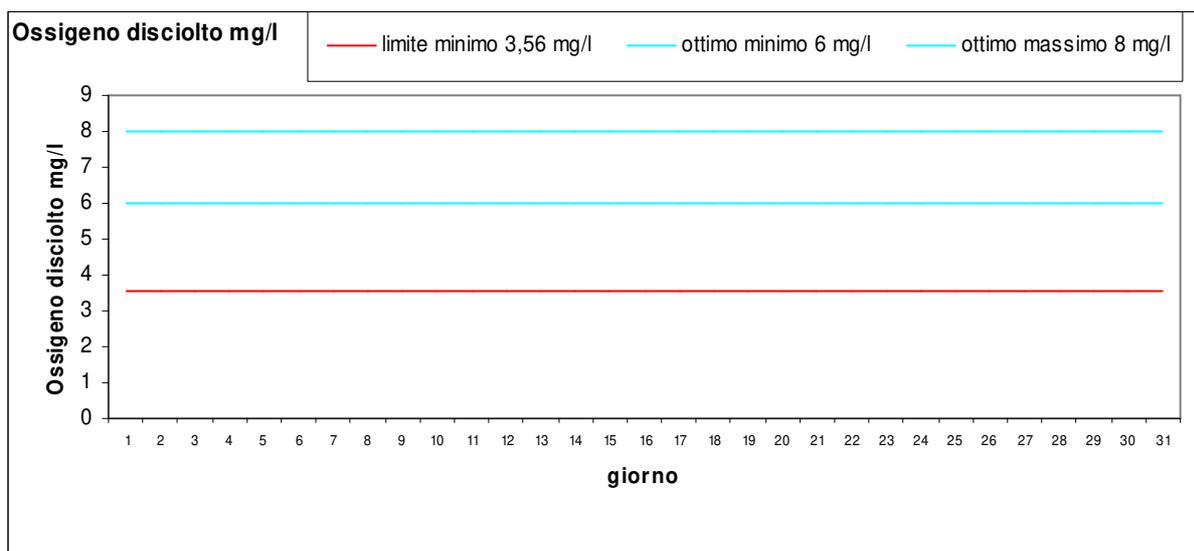

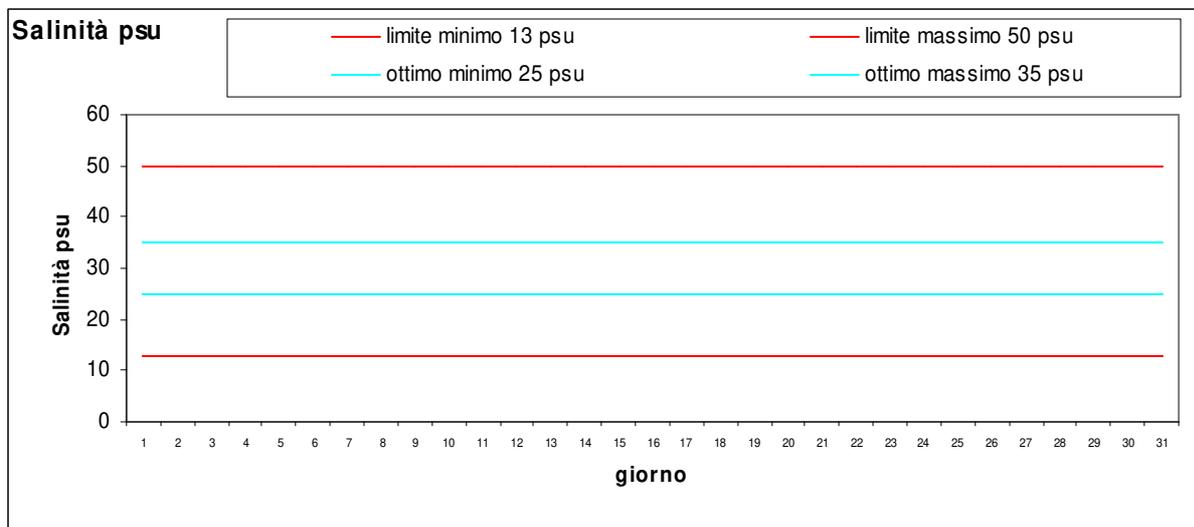

I valori che compresi tra le due linee continue azzurre rappresentano situazioni ottimali, quelli che stanno sopra alla linea rossa superiore e sotto alla linea rossa inferiore corrispondono a condizioni di non vitalità, quelli che invece stanno tra una linea azzurra e una linea rossa esprimono situazioni di vita che vanno da buono a sofferente man mano che si allontanano dalla linea azzurra e si avvicinano a quella rossa.

Allo scopo di rendere più semplice l'interpretazione dei risultati sono inserite di seguito le illustrazioni grafiche con i soli limiti vitali e l'intervallo ottimale per ciascun parametro.

Per l'anno 2021 si evidenziano le situazioni di ipossia/anossia con valori di Ossigeno disciolto < 2 mg/L o < 1 mg/L in quasi tutte le lagune senza conseguenze per gli allevamenti. I relativi dati sono riportati nell'allegato 4.

Rappresentazione grafica dei limiti vitali e intervallo ottimale per ciascun parametro

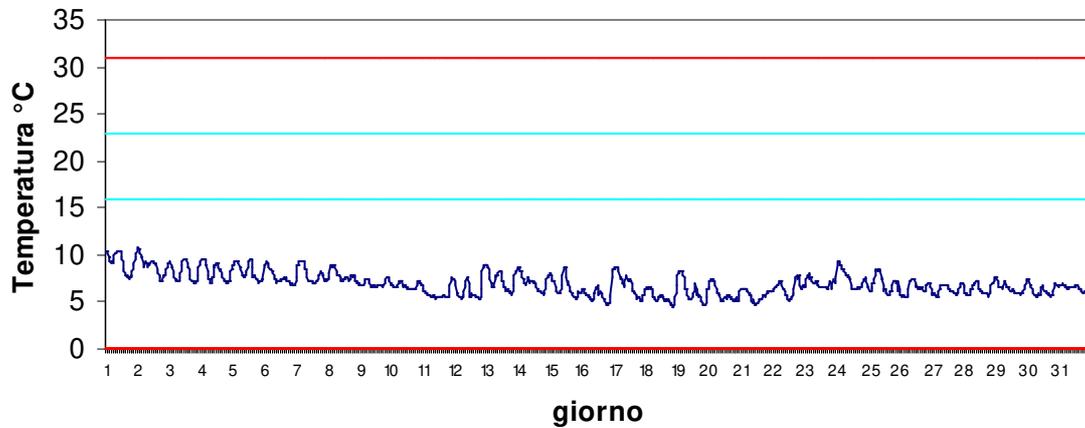

Dati mensili suddivisi per stazione e per parametro

Tabelle riepilogative

Riepilogo dei dati medi, minimi e massimi del 2021 di ogni laguna, suddivisi per trimestre.

Laguna Marinetta: il valore massimo di temperatura è stato raggiunto nei mesi di agosto (29,9°C) mentre il minimo nel mese di gennaio e febbraio (4,5°C); il massimo di pH nel mese di dicembre (9,1) mentre il minimo a maggio e agosto (7,9); il max di salinità a giugno e ottobre (36,4) e il minimo a ottobre (2,8); il massimo di ossigeno disciolto (13,5) è stato raggiunto a dicembre mentre il minimo (1,2) a luglio.

| MARINETTA | | | | | | |
|-----------|-------|-------------|-----|---------------|----------|--------------------|
| | | Temperatura | pH | Conducibilità | Salinità | Ossigeno Disciolto |
| I° TRIM | MEDIA | 8,1 | 8,4 | 32,3 | 20,1 | 9,2 |
| | MIN | 4,5 | 8,1 | 6,0 | 3,2 | 6,8 |
| | MAX | 12,7 | 8,9 | 53,8 | 35,2 | 13,0 |
| II° TRIM | MEDIA | 19,5 | 8,4 | 37,3 | 23,8 | 7,2 |
| | MIN | 11,1 | 7,9 | 11,3 | 6,5 | 2,1 |
| | MAX | 28,0 | 9,0 | 55,3 | 36,4 | 10,4 |
| III° TRIM | MEDIA | 25,3 | 8,4 | 37,5 | 23,9 | 5,9 |
| | MIN | 20,1 | 7,9 | 13,7 | 8,0 | 1,2 |
| | MAX | 29,9 | 9,0 | 54,4 | 35,8 | 9,5 |
| IV° TRIM | MEDIA | 12,8 | 8,8 | 38,3 | 24,4 | 8,4 |
| | MIN | 6,2 | 8,3 | 5,2 | 2,8 | 5,0 |
| | MAX | 22,7 | 9,1 | 54,8 | 36,4 | 13,5 |

Laguna Vallona: il valore massimo di temperatura è stato raggiunto nel mese di agosto (31,1°C) mentre il minimo (2,3 °C) a febbraio; il minimo di pH (7,9) a febbraio e settembre ed il massimo (9,0) ad luglio; il minimo di salinità (8,0) a ottobre ed il massimo (32,6) a novembre; il minimo di ossigeno (0,8) è stato registrato a settembre mentre il massimo (18,5) a febbraio.

| VALLONA | | | | | | |
|-----------|-------|-------------|-----|---------------|----------|--------------------|
| | | Temperatura | pH | Conducibilità | Salinità | Ossigeno Disciolto |
| I° TRIM | MEDIA | 8,4 | 8,4 | 29,2 | 18,0 | 11,4 |
| | MIN | 2,3 | 7,9 | 14,2 | 8,2 | 5,8 |
| | MAX | 18,1 | 8,7 | 42,3 | 27,1 | 18,5 |
| II° TRIM | MEDIA | 20,3 | 8,4 | 34,1 | 21,4 | 8,5 |
| | MIN | 8,6 | 8,0 | 25,1 | 15,3 | 1,3 |
| | MAX | 30,0 | 9,0 | 49,3 | 32,2 | 15,1 |
| III° TRIM | MEDIA | 25,8 | 8,4 | 34,5 | 21,7 | 6,5 |
| | MIN | 20,4 | 7,9 | 24,1 | 14,8 | 0,8 |
| | MAX | 31,1 | 8,7 | 43,1 | 27,6 | 12,7 |
| IV° TRIM | MEDIA | 11,9 | 8,3 | 31,9 | 19,9 | 9,9 |
| | MIN | 5,4 | 8,0 | 13,7 | 8,0 | 5,1 |
| | MAX | 22,4 | 8,6 | 49,8 | 32,6 | 13,6 |

Laguna Basson: il valore massimo di temperatura è stato raggiunto nel mese di luglio (31,0°C) mentre il minimo (2,7°C) a febbraio; il minimo di pH (8,0) a marzo e maggio mentre il massimo (8,9) a marzo, aprile, giugno e agosto, il minimo di salinità (0,7) a maggio e il massimo (41,1) a ottobre; il minimo di ossigeno (2,1) è stato registrato a settembre mentre il massimo (15,5) a gennaio.

| BASSON | | | | | | |
|-----------|-------|-------------|-----|---------------|----------|--------------------|
| | | Temperatura | pH | Conducibilità | Salinità | Ossigeno Disciolto |

Episodi di ipossia/anossia suddivisi per laguna

Di seguito sono riportati, per ogni singola laguna, i giorni in cui sono stati riscontrati valori puntuali di ipossia o anossia.

In rosso sono evidenziati gli episodi di anossia, valori di ossigeno disciolto (O.D.) < a 1 mg/L

In azzurro sono evidenziati gli episodi di ipossia, valori di ossigeno disciolto (O.D.) < a 2 mg/L

Laguna Marinetta luglio ipossia,
