Monitoraggio

Il rapporto rappresenta i risultati del monitoraggio ambientale delle lagune del Delta del Po effettuato nell'anno 2024 mediante rilievi in continuo dei parametri chimico-fisici di interesse, quali:

- Temperatura
- pH
- conducibilità
- salinità
- ossigeno disciolto
- clorofilla (parametro al momento non elaborato)

Il monitoraggio in continuo permette di evidenziare, in tempo reale, una situazione di disturbo ambientale, quali anossia e ipossia, che potrebbe compromettere il delicato equilibrio di questi ecosistemi e le attività produttive di acquacoltura di notevole importanza per il territorio provinciale. I risultati di questo monitoraggio, integrati con quelli del monitoraggio regionale ARPAV delle acque di transizione delle lagune del delta del Po, contribuiscono inoltre alla valutazione dello stato ambientale ai sensi del D.L. 152/06 e s.m.i.

A volte la mancanza di una continuità di dati dipende dal fatto che le sonde richiedono una manutenzione continua che non sempre può essere effettuata in campo, ad esempio a causa di condizioni meteo sfavorevoli.

Inoltre le sonde, periodicamente, vengono rimosse per una manutenzione più completa.

Area di studio

L'area in esame è compresa tra il fiume Adige a Nord ed il Po di Gnocca a Sud estendendosi quindi lungo tutta la zona del Delta del Po.

Di seguito vengono elencate le lagune nelle quali si effettua il monitoraggio.

Laguna Marinetta

Bacino ricadente nel territorio comunale di Rosolina. Comunica con il mare attraverso le bocche situate tra gli scanni e il litorale antistante di Porto Levante e con la laguna di Caleri tramite un canale. Inoltre è limitrofo alla laguna Vallona.

Laguna Vallona

Direttamente collegata con la laguna di Marinetta è un'area per la maggior parte privata. Nel giugno del 2014 è stato riaperto il collegamento diretto con il mare.

Laguna Barbamarco - Busiura

Situata tra il Po di Maistra e il Po Busa di Tramontana, occupa una superficie di 800 ha. ed è circondata da quattro valli da pesca, comunica con il mare Adriatico attraverso la bocca nord e sud.

Laguna Basson

Laguna prospiciente il mare aperto con cui comunica direttamente attraverso una stretta bocca che ne limita il ricambio idrico (G. Rallo, M. Pandolfi, 1988). Gli apporti di acqua dolce, frequenti e abbondanti, provenienti sia dal Po di Venezia che dalla Busa di Scirocco, contribuiscono al deposito di materiali limosi nel bacino.

Laguna Canarin

Laguna a forma di anello allungato comunica con il mare solo attraverso la bocca Nord.

Sacca di Scardovari

Situata nell'area meridionale del Delta del Po è la laguna più estesa e comunica con il mare attraverso due bocche artificiali. Una caratteristica interessante riguarda i fondali che rimangono sempre coperti dall'acqua anche in corrispondenza dei minimi di marea.

Rete di monitoraggio

La rete di monitoraggio è composta da 9 sonde multiparametriche dislocate in sei lagune: 3 sono posizionate nella laguna di Scardovari (1 nella zona NORD della laguna e 2 a SUD), le restanti nelle lagune di Caleri, Marinetta, Vallona, Basson, Canarin e Barbamarco.

I siti di Marinetta e Canarin sono stati attivati nel mese di Giugno in quanto è stato necessario eseguire la sostituzione del palo che sorregge la struttura della stazione di monitoraggio.

Area di monitoraggio

Strumentazione

Tutte le stazioni di monitoraggio sono attrezzate con sonde YSI EXO2 o EXO3.

Nella tabella seguente sono indicate le tipologie di sonde installate e i parametri chimico-fisici per ogni singola stazione di monitoraggio.

STAZIONE	SONDA	SENSORI				
		Temperatura	pH	Conducibilità Salinità	Ossigeno disciolto	Clorofilla
MARINETTA	EXO3	X	X	X	X	X
VALLONA	EXO2	X	X	X	X	X
BASSON	EXO3	X	X	X	X	
CANARIN	EXO3	X	X	X	X	X
BARBAMARCO	EXO3	X	X	X	X	X
SCARDOVARI MARE	EXO2	X	X	X	X	X
SCARDOVARI INTERNO	EXO3	X	X	X	X	X
SCARDOVARI SANTA GIULIA	EXO3	X	X	X	X	X
CALERI	EXO3	X	X	X	X	X

Nelle sonde YSI EXO gli slot per i sensori sono universali, quindi tutti i sensori possono essere installati in tutte le porte, con facili operazioni plug & play. I sensori sono smart e, appena installati, sono in grado di comunicare con la sonda configurandosi automaticamente. Inoltre ogni sensore memorizza al suo interno tutti i dati relativi all'ultima calibrazione. Tutti i sensori sono in titanio con connettori "wet mateable" in grado di garantire le connessioni sonda-sensori anche in condizioni di bagnato, evitando così corto-circuiti e sovratensioni.

Le sonde sono munite di sensori di:

- temperatura
- pH
- conducibilità
- ossigeno disciolto LDO
- salinità
- clorofilla

Le sonde sono collegate attraverso un cavo ad un terminale di superficie che registra le informazioni inviate dalla sonda e provvede alla loro alimentazione.

Lo stesso invia, mediante GSM, i dati ad una stazione di riferimento consentendo lo scarico e utilizzo degli stessi.

La stazione è alimentata da batterie ricaricabili attraverso un pannello fotovoltaico posizionato sulla stazione stessa. Inoltre è protetta da eventuali scariche elettriche dovute ad eventi atmosferici mediante dei moduli soppressori di transienti.

Le letture avvengono contemporaneamente per tutti i sensori ad intervalli di 30 minuti.

Manutenzione e parametri rilevati

I dati delle sonde multiparametriche sono controllati in campo attraverso misure di controllo con una sonda di riferimento portatile. In caso di anomalie i sensori vengono sostituiti con altri precedentemente calibrati, con soluzioni di riferimento, in laboratorio.

I trasferimenti dalla terraferma al sito dove sono installate le sonde avvengono grazie alla collaborazione con i pescatori dei Consorzi che operano nelle lagune.

La manutenzione consta di due uscite settimanali nel periodo primavera/estate e ogni quindici giorni nel periodo autunno/inverno.

Le uscite si effettuano in maniera alternata da un tecnico di ARPAV ed un tecnico della ditta esterna, opportunamente formati; occasionalmente in contemporanea da entrambi i tecnici.

Nello specifico durante la manutenzione vengono eseguite:

- letture in parallelo della sonda installata con una sonda di riferimento;
- recupero e pulizia del corpo sonda, dei sensori e della gabbia di protezione;
- verifica del corretto funzionamento, dopo la pulizia, della sonda confrontandola con la sonda di riferimento.

Con cadenze temporali diverse viene inoltre effettuata anche la pulizia del pannello fotovoltaico, del tubo di calma che contiene la sonda, la verifica di tutte le parti elettriche nonché del sistema di acquisizione e trasmissione dati.

Al termine di ogni manutenzione si procede alla validazione dei dati prodotti nel periodo che intercorre tra due manutenzioni e successivamente alla pubblicazione grafica degli stessi sul bollettino giornaliero.

Temperatura

La temperatura viene misurata in gradi centigradi e le sue variazioni risultano essere importanti per lo sviluppo, la riproduzione e la crescita delle popolazioni di molluschi che rappresentano una fonte produttiva di notevole importanza per gli operatori della zona.

Alla temperatura sono correlati i problemi di eutrofizzazione e il tasso di ossigeno disciolto che è tanto più alto quanto più bassa è la temperatura dell'acqua.

pH

Il pH indica l'acidità dell'acqua e i suoi valori vanno da 0 (acido) a 14 (basico) passando per 7 (neutro).

Nonostante l'ampio spettro, il pH in condizioni normali non subisce mai brusche variazioni grazie al potere tampone dell'acqua. Normalmente è intorno a valori di neutralità (tra 6 e 9) che risultano essere vitali per gli organismi acquatici.

Brusche variazioni possono essere causate da scarichi improvvisi di sostanze chimiche acide o basiche che in genere hanno conseguenze letali per la vita acquatica.

Valori di pH inferiori alla norma, ma non in maniera evidente, possono essere indice di fenomeni di decomposizione organica, mentre valori appena superiori alla norma possono essere collegati a fenomeni importanti di fioriture algali.

Salinità

La salinità viene espressa in mg/L e calcolata a partire dal valore della conducibilità. Essa dipende molto dall'apporto dei fiumi, dalle precipitazioni e dalle maree.

Ossigeno disciolto

L'Ossigeno è uno dei parametri determinanti per la vita dei molluschi.

La quantità di ossigeno disciolto nell'acqua è variabile. La sua presenza dipende dallo scambio gassoso che avviene tra acqua e aria, dalla sua solubilità, dalle correnti di marea, dal moto ondoso, dalla fotosintesi algale (fitoplancton) e dalla respirazione.

La solubilità dell'ossigeno in acqua dipende dalla salinità e dalla temperatura.

Alla stessa temperatura l'acqua dolce contiene più ossigeno di quella salata.

Gli scambi gassosi aria-acqua sono correlati alla solubilità, al vento e al moto ondoso

Le correnti di marea e il moto ondoso favoriscono l'aumento della quantità di ossigeno in soluzione.

Il bilancio dell'ossigeno è dato dal rapporto fotosintesi/respirazione: se il rapporto è > 1 abbiamo sviluppo di ossigeno perché la fotosintesi è maggiore della respirazione e quindi aumenta la quantità di ossigeno disciolto, se < 1 abbiamo consumo di ossigeno e quindi una diminuzione dell'ossigeno disciolto perché i processi di respirazione e decomposizione della sostanza organica prevalgono sui processi di produzione primaria o foto sintetica.

Clorofilla

La clorofilla a è un indicatore primario della biomassa fitoplanctonica .

Come tale risulta sensibile alle variazioni dei livelli trofici determinati dagli apporti dei carichi di nutrienti (azoto e fosforo) provenienti dai bacini afferenti alle lagune .

Diffusione dei risultati

I dati rilevati dalle sonde multiparametriche vengono divulgati giornalmente in forma grafica sul sito dell'Agenzia Regionale per l'Ambiente.

I grafici, aggiornati ogni 3 ore, rappresentano i dati rilevati dalle sonde negli ultimi 3 giorni.

I dati di clorofilla non sono pubblicati in quanto per mancanza del sensore di riferimento non è stato possibile validarli

Sintesi dei risultati

Per un'interpretazione rapida dei dati sono stati presi in considerazione i limiti di sopravvivenza e i range ottimali di crescita per la fauna ittica. In particolare sono stati presi come riferimento quelli relativi alla vongola verace, essendo l'area di studio a vocazione molluschiicola. I valori riportati in tabella 1 sono stati presi dal "Manuale di divulgazione Serie Acquacoltura TAPES PHILIPPINARUM" (pubblicazione edita da Veneto Agricoltura – Azienda regionale per i settori agricolo forestali e agro alimentari).

Tabella 1 – Limiti vitali e range ottimale di crescita per *Tapes philippinarum*

Parametro	Limiti vitali		Intervallo ottimale	
Temperatura - °C	0	31	16	23
pH – unità di pH	>7,5		7,8	8,2
Salinità - ppm	13	50	25	35
Ossigeno – mg/l	> 3,56		6,0	8,0

I risultati del monitoraggio sono rappresentati in forma di grafico a partire dalla pagina 19. Per ogni parametro c'è un grafico dedicato, nel quale sono evidenziati con linee continue colorate i limiti superiore ed inferiore di sopravvivenza (color rosso) e i limiti superiore ed inferiore dell'intervallo ottimale di crescita (color azzurro) presi come valore numerico senza il simbolo ">" o "<" (vedi tabella 1). Ad esempio per il pH il limite vitale riportato in grafico corrisponde a 7.5 unità di pH, mentre per l'ossigeno disciolto il limite vitale riportato in grafico è uguale a 3,56 mg/l.

I valori che compresi tra le due linee continue azzurre rappresentano situazioni ottimali, quelli che stanno sopra alla linea rossa superiore e sotto alla linea rossa inferiore corrispondono a condizioni di non vitalità, quelli che invece stanno tra una linea azzurra e una linea rossa esprimono situazioni di vita che vanno da buono a sofferente man mano che si allontanano dalla linea azzurra e si avvicinano a quella rossa.

Allo scopo di rendere più semplice l'interpretazione dei risultati sono inserite di seguito le illustrazioni grafiche con i soli limiti vitali e l'intervallo ottimale per ciascun parametro.

Per l'anno 2024 si evidenziano le situazioni di ipossia/anossia con valori di Ossigeno disciolto < 2 mg/L o < 1 mg/L in quasi tutte le lagune senza conseguenze per gli allevamenti. I relativi dati sono riportati nell'allegato 4.

Rappresentazione grafica dei limiti vitali e intervallo ottimale per ciascun parametro

Tabelle riepilogative

Riepilogo dei dati medi, minimi e massimi del 2024 di ogni laguna, suddivisi per trimestre.

Laguna Marinetta: i dati sono disponibili dal III e IV trimestre il valore massimo di temperatura è stato raggiunto nei mesi di agosto (31,4°C) mentre il minimo nel mese di dicembre (6,4°C); il massimo di pH nel mese di ottobre (8,6) mentre il minimo a ottobre (7,4); il max di salinità a dicembre (44,3) e il minimo a ottobre (1,1); il massimo di ossigeno disciolto (13,0) e il minimo (3,2) è stato raggiunto nel mese di luglio.

MARINETTA						
		Temperatura	pH	Conducibilità	Salinità	Ossigeno Disciolto
I° TRIM	MEDIA					
	MIN					
	MAX

Allegato 4

Episodi di ipossia/anossia suddivisi per laguna

Di seguito sono riportati, per ogni singola laguna, i giorni in cui sono stati riscontrati valori puntuali di ipossia o anossia.

In rosso sono evidenziati gli episodi di anossia, valori di ossigeno disciolto (O.D.) < a 1 mg/L

In azzurro sono evidenziati gli episodi di ipossia, valori di ossigeno disciolto (O.D.) < a 2 mg/L

Laguna Canarin luglio ipossia, settembre ipossia, novembre ipossia/anossia
