Introduction

This document will be resumed the list of the available data for the Astico pilot case study. These data will be used for the construction of the indicators of the MCA analysis.

Available data

Available data for the Astico pilot case study, mainly concern the river reach close to the Bessè power plant, which will be the hydropower plant on which the MCA analysis will be applied and tested.

The listed data sets have different origins. A part of them, concerning the economy indicators, have been directly furnished by the electricity producer, that is the private society Eusebio Energia. Beside the production data, Eusebio Energia has furnished also discharge and water level measures in a river station. Some important environmental indicators come from different monitoring programs promoted by the Province of Vicenza. Part of the hydrologic data and most of the chemical data are on the other hand collected and managed directly by ARPAV.
