## PREMESSA

Questa relazione rappresenta la sintesi conclusiva di un lungo e attento lavoro di verifica e analisi dei livelli freatici registrati dal **1997 al 2006** dalle stazioni di osservazione manuale della rete dell'ex Ufficio Idrografico e Mareografico di Venezia trasferita ad ARPAV ai sensi della DGR 14.11.2003, n° 3501. Con questa delibera la Regione ha delegato ad ARPAV le funzioni già di competenza dell'ex Ufficio Idrografico e Mareografico di Venezia per il rilievo, pubblicazione e studio delle informazioni idrologiche come previsto dall'art. 22 del D.P.R. 24.01.1991, n° 85.

Come è noto l'ex Ufficio Idrografico di Venezia, costituito sin dal 1906, nell'ambito della struttura del Magistrato alle Acque di Venezia, aveva il compito di rilevare i parametri idrologici ritenuti indispensabili per una corretta gestione del complesso sistema idrografico del Triveneto, ossia tutti i parametri caratterizzanti il complesso del grande sistema idrologico regionale. Tale fondamentale lavoro di monitoraggio venne sintetizzato, a partire dal **1916**, con la pubblicazione degli **Annali Idrologici** che raccoglievano di anno in anno le osservazioni della capillare rete di osservazione distribuita sui territori di pertinenza del citato Magistrato. La regolare pubblicazione di tali documenti, ha rappresentato una testimonianza della cura e dell'attenzione rivolta alle acque e alla quantificazione della risorsa almeno per la prima metà del secolo scorso; attenzione legata, probabilmente, anche al contemporaneo sviluppo della rete di utilizzazione idroelettrica dei bacini montani.

A partire dagli anni '50 si è assistito a un progressivo ridimensionamento del Servizio Idrografico Nazionale e delle risorse finanziarie a questo destinate dal bilancio dello Stato tanto che, della

rete di osservazione freatimetrica nel Veneto strutturata nel 1958 su 90 stazioni, alla fine del 2003 rimanevano sole 43 stazioni, tutte obsolete<sup>1</sup>, di cui due dotate di idrometrografo a galleggiante mentre tutte le altre ad osservazione manuale. Tuttavia, pur con queste limitazioni, **queste osservazioni sono di fondamentale importanza in quanto le uniche in grado di dare informazioni relative alle tendenze a lungo periodo delle risorse idriche sotterranee** e quindi permettere di quantificare le variazioni e le dinamiche del grande sistema idrogeologico regionale (vedi paragrafo *Analisi dei dati 1997-2006*). Per gli stessi limiti prima ricordati, il numero delle stazioni non è sufficiente a ricostruire la distribuzione territoriale delle variazioni né a quantificarne esattamente la dinamica. In questo senso, evidenziando la criticità dei trend all'impoverimento rilevati negli ultimi anni nonché l'importanza strategica di queste risorse, ARPAV ha realizzato una serie di progetti proposti alla Regione per l'ammodernamento e il potenziamento della rete di monitoraggio quantitativo (progetto IRMA<sup>2</sup> e progetto MIRAS<sup>3</sup>). Quest'ultimo in particolare prevede la revisione e l'ottimizzazione del monitoraggio regionale delle acque sotterranee attraverso l'integrazione e l'ammodernamento delle reti attualmente esistenti con indubbi benefici sia in termini di efficacia che di costi.

---

<sup>1</sup> Tutte le stazioni infatti si avvalgono di strumenti meccanico-manuali che richiedono la presenza costante di un osservatore e che rendono il processo di acquisizione dati poco efficace e soggetto ad errori con conseguente scadimento della qualità del dato.

<sup>2</sup> Progetto IRMA " Impostazione di una Rete di Monitoraggio Automatizzata per la protezione delle acque sotterranee del Veneto", a cura ARPAV – Osservatorio Regionale Acque, con l'obiettivo di realizzare una rete di monitoraggio quali-quantitativa delle acque sotterranee della pianura veneta in grado di fornire dati in tempo reale sul livello della falda e su alcuni parametri chimici.

<sup>3</sup> Progetto di adeguamento della rete di monitoraggio delle acque sotterranee del Veneto a cura di ARPAV - U.O. Rete Idrografica Regionale proposto alla Regione del Veneto in data 26.01.2006.

Con questo lavoro si vuole dare continuità al prezioso servizio di archiviazione e pubblicazione delle osservazioni freatimetriche raccolte negli anni passati già con gli Annali Idrologici la cui ultima edizione risale al 1996. La struttura annua dei contenuti rivista e aggiornata è articolata in due parti: la prima in cui vengono raccolti e ordinati in tabelle le caratteristiche, i valori delle osservazioni registrati ogni 3 giorni e i valori medi mensili e annui delle misure per ogni stazione attiva; la seconda parte invece dove si è rappresentato graficamente l'andamento annuale dei livelli raffrontandoli con i valori medi, minimi e massimi mensili osservati negli ultimi 20 anni di osservazione. Per una maggiore comprensione dei regimi freatimetrici, per ogni stazione si è voluto anche inserire una parte contenente i diagrammi raffiguranti gli ultimi 10 anni di attività. A queste rappresentazioni si è voluto inoltre introdurre un sintetico quanto

certamente non esauriente commento di sintesi ricavato dall'analisi delle osservazioni raccolte. Per facilitare l'individuazione nel territorio delle stazioni, si è elaborato una rappresentazione orografica del Veneto con in evidenza la rete idrografica principale (Figura 1, pag. 6).

Infine si vuole evidenziare come l'importanza della conoscenza del *“regime dei livelli delle acque sotterranee”* è stata recentemente rimarcata dalla Direttiva EU 2000/60 per poter adeguatamente classificare lo stato quantitativo dei corpi idrici sotterranei. Detta Direttiva prescrive che la rete di monitoraggio delle acque sotterranee debba *“fornire una stima affidabile dello stato quantitativo di tutti i corpi idrici o gruppi di corpi idrici sotterranei, compresa la stima delle risorse idriche sotterranee disponibili”* (Direttiva EU 2000/60, Allegato V 2.1).

## TERMINOLOGIA

ACQUE SOTTERRANEE: acque che si trovano al di sotto della superficie del suolo nella zona di saturazione.

FALDA FREATICA: acque sotterranee costituente un corpo idrico definito e contenuto in un acquifero libero.

STAZIONE FREATIMETRICA: stazione adibita alla misura idrometrica della falda freatica.

LIVELLO IDROMETRICO (m): altezza del livello idrico nel pozzo sul livello medio del mare.

BACINO IDROGRAFICO: territorio dal quale le acque pluviali o di fusione delle nevi e dei ghiacciai, defluendo in superficie, si raccolgono in un determinato corso d'acqua direttamente o a mezzo di affluenti.

# CONTENUTI

## TABELLE

Le tabelle riportate a seguire sono relative alle stazioni freatimetriche che hanno funzionato per almeno 1 mese nell'anno corrispondente. La tabella I è riassuntiva delle caratteristiche principali di tutte le stazioni mentre le tabelle II (Osservazioni freatimetriche) e III (Escursione, valori medi mensili ed annui dei livelli freatici) si ripetono ogni anno dal 1997 al 2006 in quanto illustratrici delle osservazioni eseguite. In **grassetto** e in *corsivo* sono stampati rispettivamente i valori massimi ed i valori minimi. L'intervallo di tempo utilizzato per il calcolo dei parametri statistici è 20 anni (1987-2006 compresi, dove non diversamente specificato).

TABELLA I – Elenco delle stazioni attive suddivise per bacino idrografico con indicato il codice identificativo (ID), le coordinate in Gauss Boaga fuso Ovest, l'anno di inizio delle osservazioni e la quota sul livello del mare della stazione, del valore misurato minimo, medio e massimo espresso in metri (m).

TABELLA II – Riporta i valori dei livelli freatici, riferiti al medio mare, rilevati nei giorni 2, 5, 8, 11, 14, 17, 20, 23, 26 e 29 di ogni mese (eccetto per il mese di febbraio quando non bisestile), ed il valore medio corrispondente.

TABELLA III – Per ognuna delle stazioni considerate nella Tabella I, riporta i valori medi mensili ed annui dei livelli freatici e la quota del piano di riferimento ove la stazione è situata.

## DIAGRAMMI FREATIMETRICI

I diagrammi pubblicati rappresentano l'andamento del livello freatico sul livello medio mare (m s.l.m.) per ciascuno degli anni di osservazione delle stazioni freatimetriche considerate. Tale andamento viene raffigurato con la linea nera più marcata. Per una maggiore

comprensione del fenomeno sono anche stati riportati i valori medi, massimi e minimi del mese (rispettivamente con linee sottili continue, tratteggiate e con punti e tratti alternati) registrati negli ultimi 20 anni di osservazione.

**LEGENDA**

- Stazione con numero identificativo
- Limite amministrativo provinciale
- Fascia delle risorgive

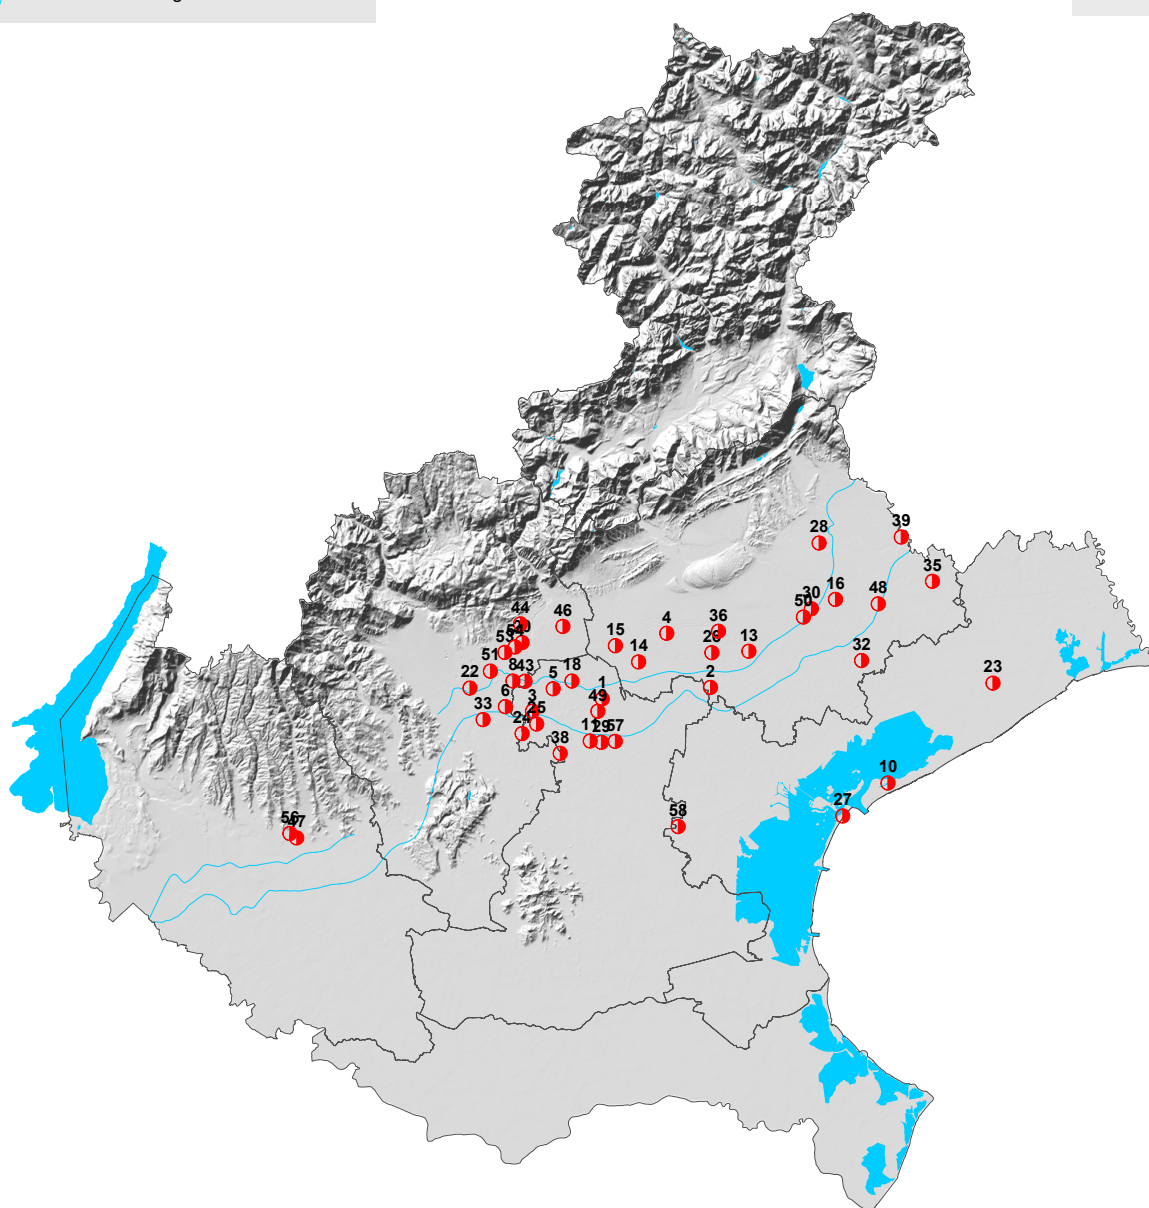

FIGURA 1: Rappresentazione della rete freatimetrica regionale nel periodo 1997- 2006.

(segue)

(1) Stazione soggetta a variazione di regime idrometrico a partire dal 1980

(2) Negli annali parte Seconda degli anni dal 1972 al 1987 compresi, i valori freatimetrici pubblicati sotto il nome CASA SCHIAVO devono essere attribuiti al pozzo denominato SCHIAVON.

(3) Nei precedenti annali la stazione è sempre stata erroneamente chiamata Scoazzolo; la stazione freatimetrica è ubicata presso l'abitato di Scovazzolo.

(4) Caposaldo a quota 25,42 m s.m. da maggio 1993.

(5) Fino alla data di istituzione della stazione di Badoere, anno 1971, la quota del caposaldo di riferimento è stata erroneamente indicata in 33,26 m invece che in 23,26; tutti i valori numerici riportati nei precedenti annali devono essere corretti sottraendo ad essi il valore 10,00.

\* media normale riferita a un periodo inferiore a 20 anni

## CONCLUSIONI

L'attività di misura della rete freatimetrica regionale fin dagli anni della sua attivazione ha permesso la raccolta di serie continue di osservazioni (in molti casi superiore a 80 anni) dalle quali è possibile ricostruire i trend a medio-lungo termine dei più importanti acquiferi regionali. Pur con i limiti di misura che presenta la rete di monitoraggio legata principalmente alle modalità di rilevamento<sup>4</sup> le misure così raccolte sono per dettaglio e continuità, le uniche in ambito regionale da cui è possibile quantificare le dinamiche in atto nei più importanti acquiferi regionali.

L'andamento dei livelli freatimetrici degli ultimi 10 anni (1997-2006), come si evince dall'analisi dei diagrammi freatimetrici, ha registrato in estrema sintesi una duplice e opposta tendenza: una importante e generalizzata diminuzione nella fascia di alta pianura sede dell'acquifero indifferenziato e, per contro, un sensibile aumento dei livelli nel dominio della media-bassa pianura (con tutte le eccezioni del caso). Tale tendenza è materializzata nei diagrammi freatimetrici attraverso una linea retta la cui coefficiente angolare viene riportata per ogni stazione in tabella B a seguire. Tra le cause di questo fenomeno si indica, oltre alle sicure variazioni delle voci del bilancio idrologico (modificazione dei fattori di alimentazione, drenaggio e prelievo), anche il processo indiretto legato alla subsidenza che interessa vaste zone della bassa pianura veneta come confermato da recenti studi.<sup>5</sup> I valori di subsidenza emersi (da 3 a 5 mm/anno) dimostrano in modo inequivocabile l'influenza dell'abbassamento della superficie del suolo sull'entità della variazione del livello freatico registrato negli anni. Più complessa

e non sintetizzabile invece appare la situazione della fascia di media pianura dove sono riconoscibili andamenti locali diversi per bacino di appartenenza.

Il dato più importante che emerge da questa analisi è l'abbassamento freatico che interessa tutto il territorio di alta pianura, sede del potente acquifero indifferenziato. In questi ultimi 10 anni il decremento della superficie freatica si è conclamato in modo netto con tassi di abbassamento sensibilmente alti raggiungendo per alcune stazioni dell'alta pianura del Brenta (Casa Reginato – Crosara di Nove) anche valori di 40-50 cm/anno.
